2×5

Z(1st Sm.)-Computer Sc.-H/CC-2/CBCS

2023

COMPUTER SCIENCE — HONOURS

Paper: CC-2

Full Marks: 50

The figures in the margin indicate full marks.

Candidates are required to give their answers in their own words as far as practicable.

Answer question no. 1 and any four from the rest.

- 1. Answer any five questions :
 - (a) What are the keywords in C? Give two examples.
 - (b) Name the four storage-class specifications included in C.
 - (e) How does an array variable differ from an ordinary variable?
 - (d) Give suitable examples of any four different types of operators included in C language.
 - What are the functions of increment operator ++ and decrement operator --?
 - (f) What is a string constant? How does it differ from a character constant?
 - (g) State at least two advantages of using functions in a program.
 - (h) What is a pointer? How is it declared?
- 2. (a) Consider a C program that contains the following statements:

```
# include <stdio.h>
main()
{
   int i;
   float x;
   char c;
   - -
   - -
   scanf("%3d %5f %c", &i, &x, &c);
   - -
   - -
   - -

What will be the contents of i, x and c if the following data is given as input?

15 675.32 V

Please Turn Over

- (b) State the purpose of using 'getchar' and 'putchar' functions.
- (c) How can short integer, long integer and double-precision arguments be indicated within the control string of a 'printf' function?
- 3. (a) Write a program in C which will read a line of text given in lower case character-by-character and convert it into upper case character-by-character.
 - (b) Briefly describe two types of looping used in C programs with suitable example.

6:4

- 4. (a) Compare the use of a switch statement with the use of nested if-else statements.
 - (b) What are the purposes of break and continue statements? Explain with suitable example.
 - (c) Explain what happens when the following statement is executed:

if
$$(abs(x) < x \min) x = (x > 0) ? x \min : -x \min$$

4-4-2

- (a) Write a program segment in C that will use a loop to calculate the sum of every third integer, begining with i = 2 (i.e., calculate the sum 2 + 5 + 8 +) for all the values of i that are less than 100.
 - (b) What are formal and actual arguments of a function used in a C program? How are they related?
 - (e) What is the purpose of a return statement?

5+3+2

- (a) Write a program segment in C to initialize all the elements of a 2-dimensional array with a constant 6. say 5. Consider the size of the array to be 15×20 .
 - (b) What is meant by dynamic memory allocation? What library function is used to allocate memory dynamically? 5 + (3 + 2)
- 7. (a) What is a structure? How does it differ from an array?
 - (b) Declare the structure of a data. Now consider another structure (account) which contains the account_no, account_type, name, and balance of a customer and (date) as one of its members last payment. The declaration of date precedes the declaration of account.

The composition of account is shown as follows:

4+6

- 8. What is the primary advantage to using a data file?
 - (b) State the six types of file_type, specifications for opening a data file.
 - (c) Which function is used to close a data file?
 - (d) Write a program segment in C to find the average of all numbers stored in a data file. 1+3+1+5
